Week 8

This week is about debating a certain topic about the design pattern
Our topic to debate against is
“The beat / pulse animation is observer pattern in its purest form”

Best zingers is from against team “Gabriel”

Debates are a valuable way to practise and reinforce our understanding of different concepts. They encourage us to recall what we have learned, think critically, and apply our knowledge to support our arguments. They also expose us to different perspectives, allowing us to identify gaps in our understanding and learn from other people's opinions. Furthermore, debating helps improve our communication skills, confidence, and ability to explain technical concepts clearly. Overall, it provides an opportunity to deepen our understanding beyond simply memorising theoretical knowledge.

Week 9

One interesting thing I learned from another team from puzzle1 was how method references can make lambda expressions much shorter and easier to read.

For example, instead of writing:

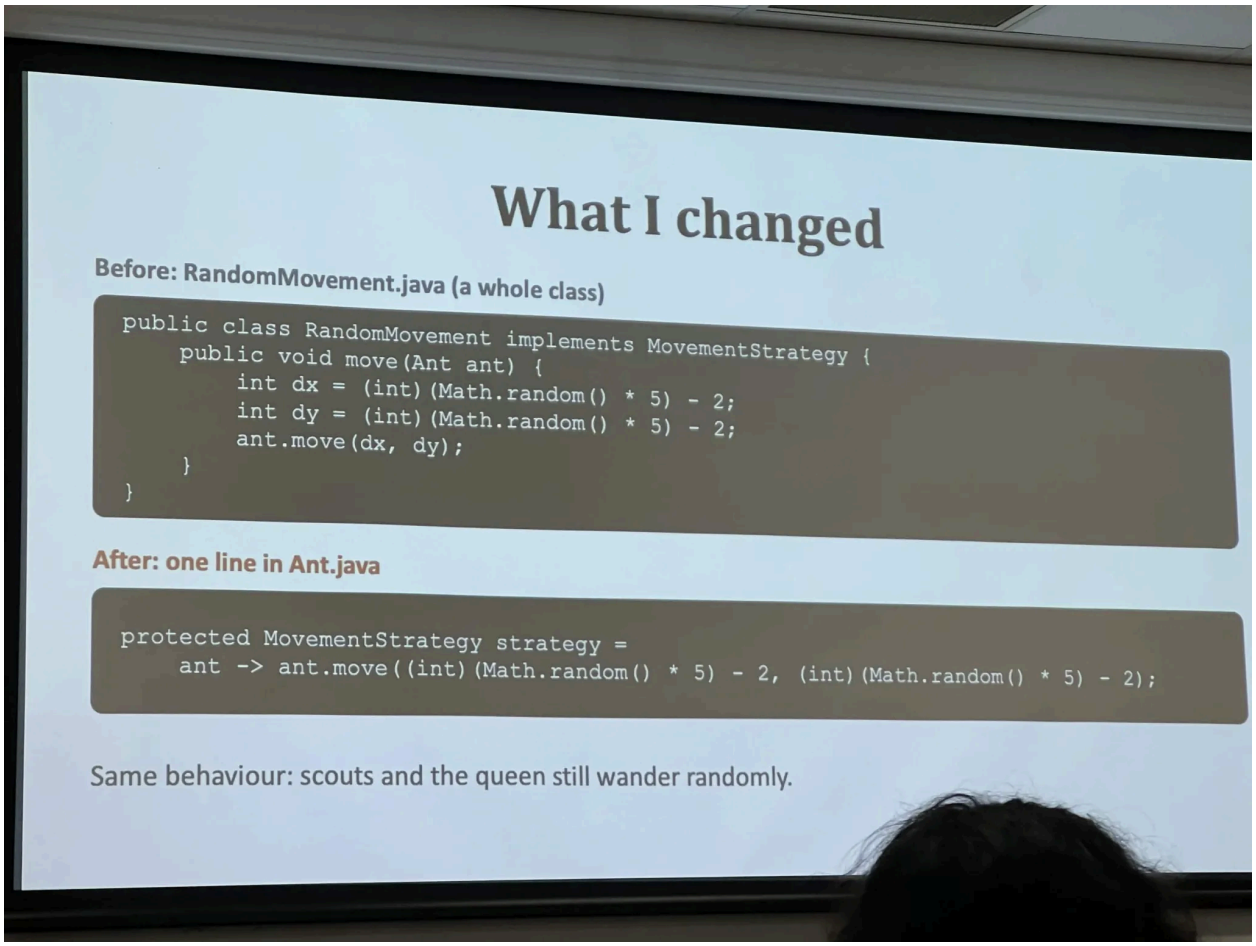

```
Comparator.comparingInt(s -> s.length())
```

they used:

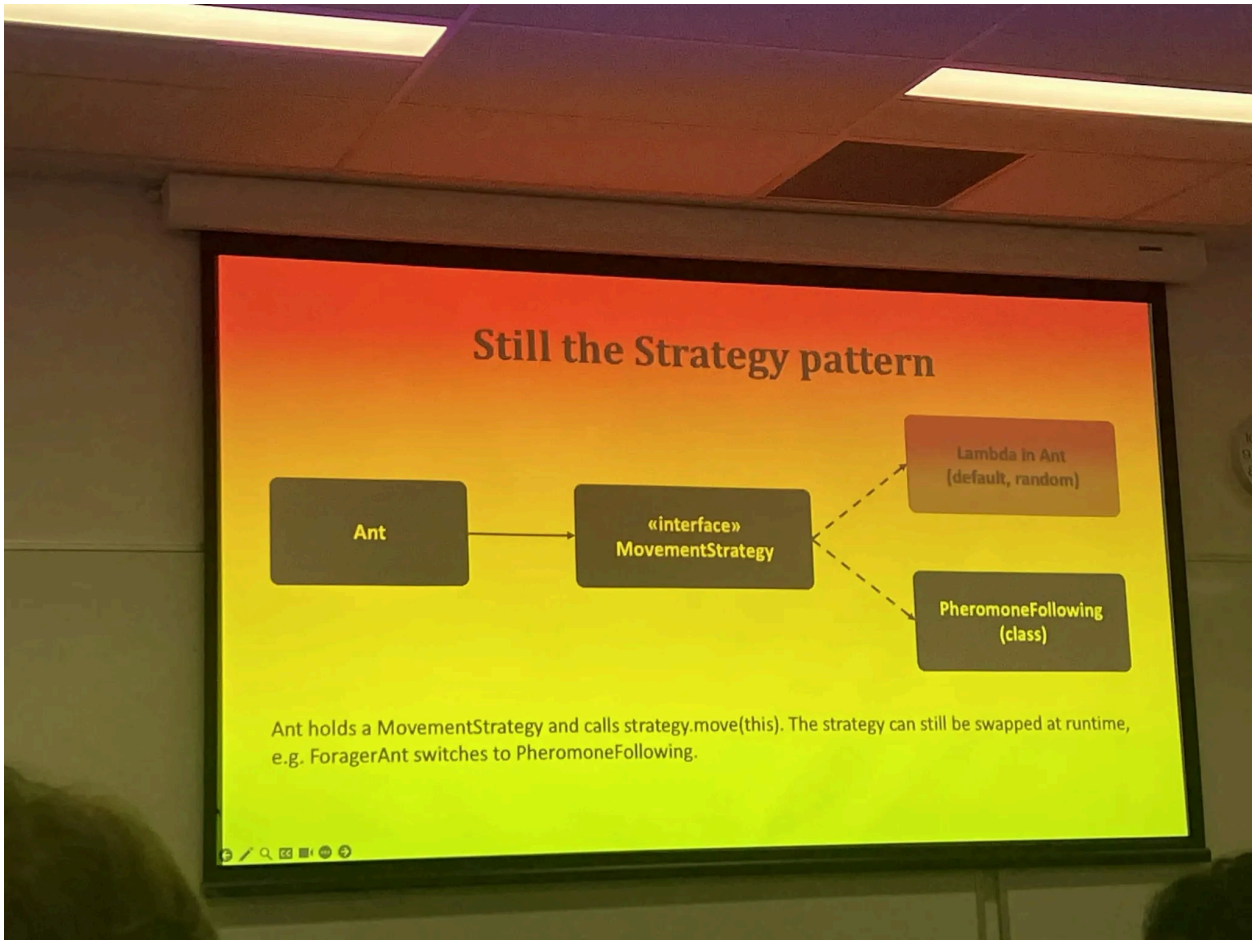

```
Comparator.comparingInt(String::length)
```

I learned that `String::length` is a method reference and is basically a shorter way of writing `s -> s.length()`. I had not used method references much before, so this was a useful lambda trick for making code shorter in the puzzle.

Week 10

This change helped me understand how the Strategy Pattern can simplify code. Previously, random movement was implemented in a separate `RandomMovement.java` class. After the change, the movement behaviour was defined directly in `Ant.java` using a lambda expression. This reduced the amount of code and removed the need for an extra class while keeping the same behaviour. I learned that lambda expressions can make code shorter and easier to read when implementing functional interfaces. However, for more complex movement behaviours, using separate classes might still be a better choice for readability and maintainability.

The Strategy Pattern is still being used even after simplifying the code with a lambda expression. The `Ant` class still depends on the `MovementStrategy` interface, which allows different movement behaviours to be used.

Week 11
Miss class due to medical condition

Granville Family Medical Centre
ABN: 63 830 714 071
Shop 2/ 25-27 South Street, Granville NSW 2142
Tel: (02) 7804 3700
Fax: (02) 7804 3737
www.granvillefamilymedicalcentre.com.au

Medical Certificate

19/10/2026

THIS IS TO CERTIFY THAT

Mr Sansarin Sermsoontornsil (DOB: 11/11/2006) has a medical condition and will be unfit for work from 19/10/2026 to 23/10/2026 inclusive.

Dr Abrar Ahmed

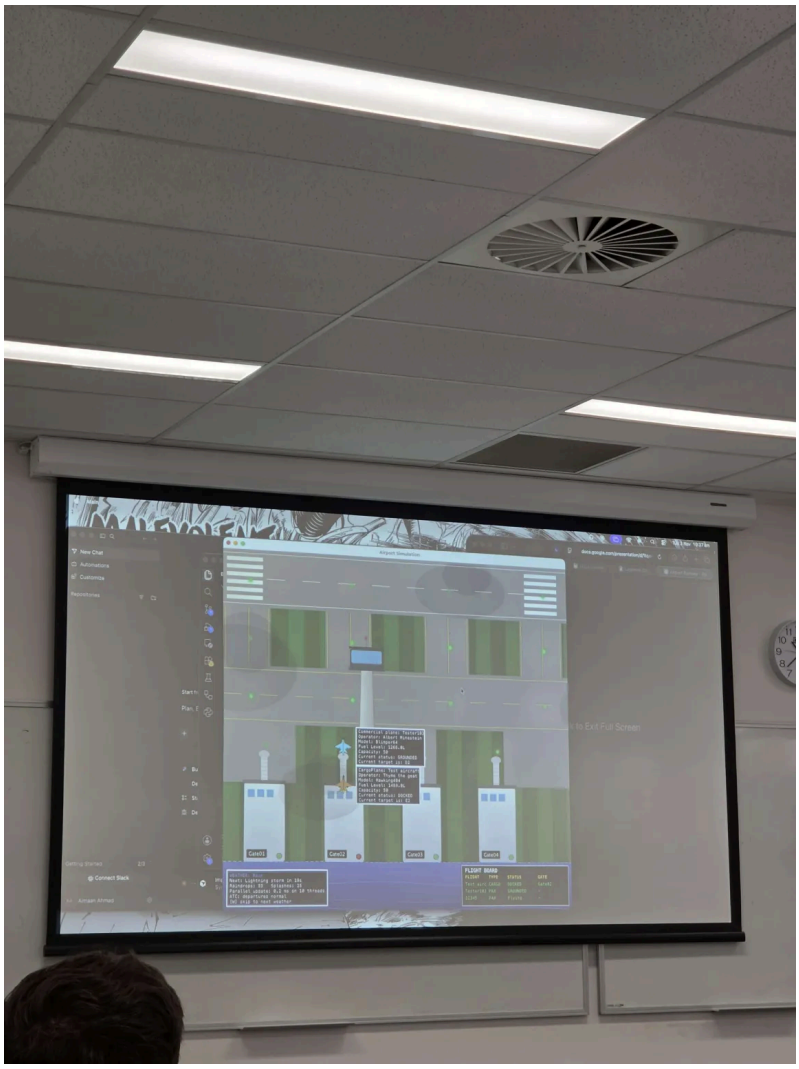

MD, FRACGP

Provider No: 5998459Y

Week 13

This week main focus is presenting the final project

First team

An airport simulation that has 4 main components

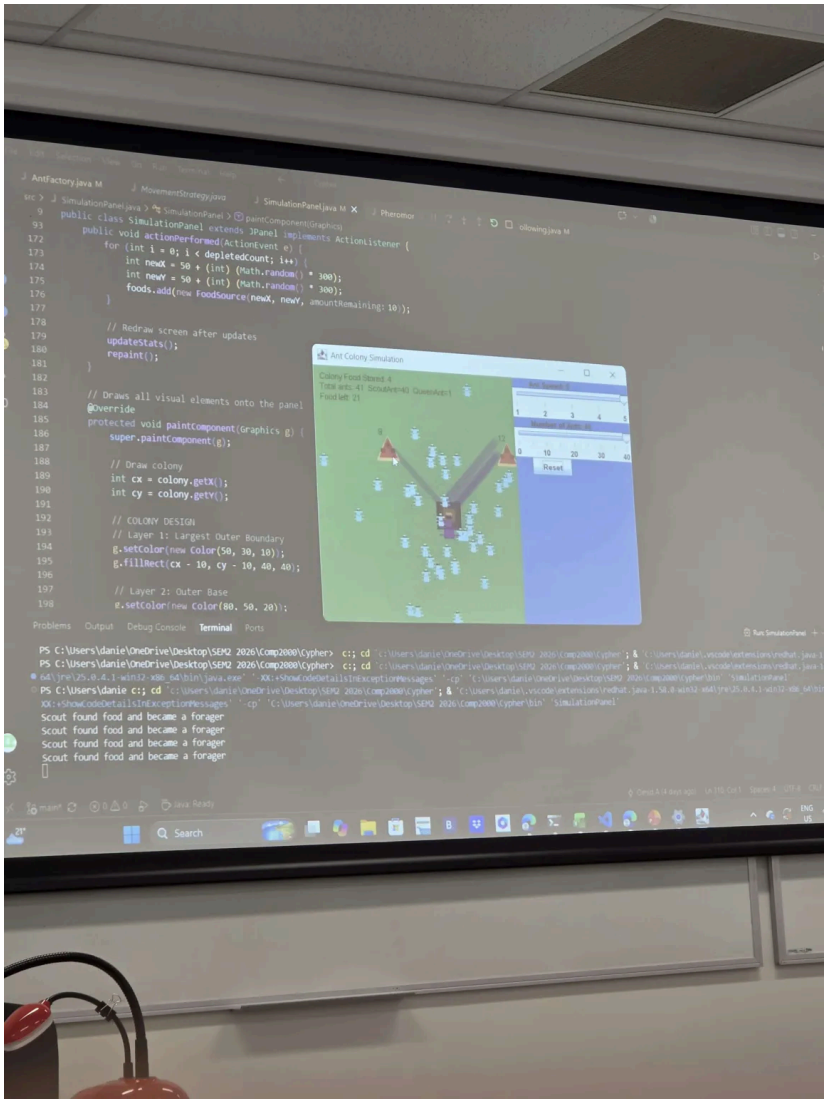

- Flight Board
- Weather Cycles
- Plane Design
- Runway Aesthetics

Weather cycle includes

- Rain
- Thunderstorm
- Daytime

Each has different effect on the Flight Board

Second Team

Ants colony simulation

- Scout ants
- Queen ants
- Food

Scout ants searching for food, once scout ants found food it will become a forager

One idea we wish to try is by adding more aesthetics for the weather in our simulation.
In the first team each weather is significantly different from another but ours is just a change or color, so we wish to implement better graphical presentation.
